

The FloMaster

When it comes to placing a cement plug, there are many issues and challenges to overcome.

Multiple fluids need to be pumped before the actual cement slurries, and all these fluids need to be uncontaminated to perform a good well clean out.

The “U” Tubing effect needs to be minimized to stop these fluids and the cement slurries from “freefalling” into the wellbore, mixing with the previously pumped fluids and becoming less effective.

Lack of surface pressure during operations make it impossible to know where the cement slurries are actually placed, and extremely difficult to post diagnose the cement job, whether good or bad.

The FloMaster overcomes all of these challenges and more!! Developed to be a fit for purpose tool in both P&A and standard casing running operations, PDG have a solution for all of your fluid issues.

The FloMaster is designed to be a stackable tool to achieve the required pressure drop, and with options for a drillable or retrievable and re-usable tool, contact PDG and get **CONTROL** of your fluids!!
